

How to install the typing program

1. Navigate to the PythonTyping folder, and run the Install Typing executable in it
2. Run the program by using the shortcut in the root directory of the S drive

That failed! What do I do Now?? – Troubleshooting guide for installation

1. Be sure that you are running python 3.7. Python 3.7 is the only officially supported version of python for our typing program. Python 3.8 works but is not officially supported and python 3.9 does not work as of May 5, 2021.
2. Make sure you are running the latest version of pip. Pip can be upgraded by opening command prompt and running the command `python -m pip install --upgrade pip`
3. Sometimes issues can be solved by right-clicking and running the Install Typing executable as an administrator. (this is rare)
4. If all else fails, follow these instructions to install manually:
 - a. Navigate to the PythonTyping folder and copy the Program Files folder to the root directory of the C drive of the machine you are trying to install on.
 - b. Open command prompt and run the following commands:
 - i. `pip install pillow`
 - ii. `pip install docutils pygments pypiwin32 kivy_deps.sdl2 kivy_deps.glew`
 - iii. `pip install kivy_deps.angle`
 - iv. `pip install kivy`
